1. Introduction

The **Production Order List** is a SAP Fiori-based web application designed for shop floor supervisors and operators at Romsons Group of Industries. It provides a real-time, consolidated view of all production orders assigned to a specific employee and plant, enabling quick actions such as operator assignment, material reservation, receipt confirmation, and job card printing —all from a single screen.

Key capabilities at a glance:

- View all open production orders for your plant in one list
- Search orders by order number, material, type, or status
- Scan a job card QR code to instantly locate an order
- Filter by House ID, Order Type, Material, Status, and Family
- Expand any order to see full order details, quantities, and material info
- Launch sub-apps for operator assignment, reservations, receipt, and printing
- Automatic session monitoring with single-session enforcement

2. Getting Started – Login

The app enforces session-based authentication. Access requires a valid employee session established through the Login App.

Login flow:

Step 1	Open the Login App in your browser (provided by your IT team).
Step 2	Enter your Employee ID and Plant code, then submit.
Step 3	The system creates a session and sets secure browser cookies.
Step 4	Navigate to the Production Order List URL. The app reads your session automatically.
Step 5	If no valid session is found, you are redirected back to the Login App.

WARNING Only one active session per employee is allowed. If you open the app in a second browser or device, the original session may be invalidated.

3. App Header

The page header is always visible and displays your identity and plant context.

Logo + Title	Romsons logo and the app name 'Production Order List'. Clicking the title area collapses / expands the filter header.
EMP ID badge	Displays your logged-in Employee ID. Read-only — for identification only.
PLANT badge	Displays your assigned Plant code. Read-only.
Logout button	Ends your session and redirects to the Login App. On small screens this moves into the overflow menu (■).

TIP On phones and small screens, the EMP ID, PLANT, and Logout buttons move into the header overflow menu (three-dot icon) to save space.

4. Search & Quick Scan

4.1 Search Bar

The search bar runs across the top of the filter area. It matches text across order number, material number, order type, and order status simultaneously.

Search field	Type any order-related keyword. Results update when you press Enter or the search icon.
Clear (×)	Clears the search term and restores the full (filtered) list.

4.2 Scan Job Card (QR / Barcode Scanner)

Tap the barcode icon beside the search bar to open the camera scanner. Point the camera at a printed job card QR code to instantly search for that order.

1. Tap the barcode icon — the scanner dialog opens and requests camera permission.
2. Point the rear camera at the QR code on the job card.
3. On a successful scan the dialog closes automatically.
4. The order number is placed in the search bar and the matching order is displayed with its panel expanded.
5. If the QR code is not a valid job card format, an error message is shown and the scanner stops.

Scanner engine	html5-qrcode 2.3.8 using ZXing — supports QR Code, Code 128, EAN-13, and other formats.
Camera used	Rear (environment-facing) camera by default.
Expected QR format	{"Order No":"000001035860","Shift Date":"27.07.2026","Shift ID":"A"}
Leading zeros	Leading zeros in the Order No are stripped automatically before searching.
HTTPS requirement	Camera access requires the app to be served over HTTPS in production. On localhost, HTTP works.

5. Filters

Six multi-select dropdown filters are available in the header. Each dropdown is populated dynamically from the data returned for your employee and plant.

House ID	Filter by production house / department.
Production Order	Filter by specific order numbers.
Order Type	Filter by order type (e.g., PP01, PP02).
Material	Filter by material / component number.
Order Status	Filter by status code (e.g., CRTD, REL, TECO).
Family	Filter by product family grouping.
Apply Filters	Click to apply all selected filter values. The list refreshes and a blue banner shows the active filter summary.
Clear Filters	Removes all filter selections and reloads the full order list.

TIP You can select multiple values in each dropdown. Filters combine with AND logic across dropdowns and OR logic within a single dropdown.

Filter behaviour notes:

- Applied filters are preserved when you release an order — you don't lose your selection after an action.
- A blue information strip below the title bar summarises active filters when any are applied.
- The filter bar shows a loading indicator while results are being recalculated.
- The first matching order is auto-expanded every time you apply or clear filters.

6. Production Order Panels

Each production order is shown as a collapsible panel. The panel header gives an at-a-glance summary; expanding it reveals full detail in a three-column layout.

6.1 Panel Header

Order number	Blue inverted badge — the production order ID.
Type badge	Blue inverted badge — order type code.
House	Department / house description.
Progress ring	Circular indicator showing completion percentage (0–100 %).
Operators	Count of operators currently assigned to the order.
Date range	Planned start and finish dates (shown as a combined Date field).
Status badge	Colour-coded status label (e.g., Created, Released, Completed).

6.2 Panel Content (Three-Column Layout)

Click or tap a panel header to expand it. The content area is split into three columns:

Order Details	Order Quantity	Material Details
• Order No • Order Type • Plant • Date (Start – End)	• Basic Start Qty • Confirmed Qty • Delivered Qty • Scrap Qty	• Material No • Material Desc • Storage Location • House

*Missing or unavailable values display as **--**. On screens narrower than 900 px the three columns stack vertically.*

7. Panel Actions

Each expanded panel has an action toolbar at the bottom. Buttons open the relevant sub-application in a new browser tab. All action buttons are **disabled** when an order is at 100 % progress.

WARNING Action buttons are greyed out and unclickable when the order's progress is 100 % (fully completed).

7.1 Assign Operators

Opens the **Operator Assignment** sub-application pre-loaded with the selected order number.

Opens in	New browser tab
URL param	?order={order number}
Use when	You need to add, change, or remove operators working on this production order.
Disabled when	Progress = 100 %

7.2 Create Reservation

Opens the **Material Reservation** sub-application for the selected order, allowing you to request materials from the warehouse.

Opens in	New browser tab
URL param	?order={order number}
Use when	Materials need to be reserved / requested for the order.
Disabled when	Progress = 100 %

7.3 Confirm Receipt

Opens the **Receipt Confirmation** sub-application. Use this when materials have been received at the shop floor and need to be acknowledged in the system.

Opens in	New browser tab
URL params	?order={order number}&navType;=order
Use when	Materials have physically arrived and you need to confirm receipt in SAP.
Disabled when	Progress = 100 %

7.4 Print Job Card

Navigates directly to the **Document Center** sub-application to print the job card for this order. No dialog is shown — the sub-app opens immediately.

Opens in	New browser tab
URL params	?doctype=jobcard■={order number}
Use when	A physical job card needs to be printed and attached to the work piece.
Disabled when	Progress = 100 %

7.5 Release Order

Releases a production order from **Created (CRTD)** status to **Released (REL)** status, signalling that production can begin.

Visible when	Order status is CRTD (Created) only
Disabled when	Progress = 100 % OR order is not in CRTD status
Effect	Status changes to REL. The order list refreshes automatically.
Filters	Applied filters are preserved after the release action.

WAR NING Release Order is the only action that changes data in SAP directly from this screen. All other buttons open a separate sub-application for the action.

8. Session Management

The app monitors your session every 20 seconds. This prevents unauthorised use and ensures data accuracy across multiple devices.

Single session enforcement	Only one active session per employee is allowed. If you log in on a second device, the original session detects the change.
New session detected	A dialog appears: 'New session detected. Refresh to continue.' Click Refresh to reload with the new session, or stay on the page (data may be stale).
Session expired / user changed	You are redirected to the Login App automatically.
Cookie-based identity	Your Employee ID, Plant, and Session ID are read from secure browser cookies set at login.

TIP If you see 'New session detected', it usually means you (or someone with your credentials) logged in on another device. Click Refresh to continue on this device.

9. Responsive Behaviour

The app adapts to any screen size from desktop monitors to smartphones.

Desktop (> 900 px)	Three-column panel layout, all header actions visible, full filter bar inline.
Tablet (600–900 px)	Filter dropdowns wrap to two rows; panel columns reduce to two per row.
Phone (< 600 px)	Filters stack to full width; panel columns stack vertically; EMP ID, PLANT, and Logout move to the header overflow (■) menu.
Camera scanner	Works on mobile devices using the rear camera. Requires HTTPS in production.

10. Troubleshooting

Orders not loading

Check your network connection. Ensure you have a valid session (your EMP ID should show in the header). Try clicking the Refresh button beside 'PRODUCTION ORDERS'.

Filters showing fewer items than expected

The filter dropdowns support up to 1,000 items each. If a value is missing, try typing part of it in the search bar instead.

Camera not working / 'Camera streaming not supported'

This occurs when the app is served over HTTP (not HTTPS) in a non-localhost environment. Contact your IT team to enable HTTPS on the server. On localhost, HTTP works normally.

'Invalid QR scanned' error

The scanned QR code does not contain the expected job card format. Ensure you are scanning a Romsons job card QR code, not another barcode.

Buttons are greyed out / disabled

The order's progress is at 100 %. Completed orders cannot be actioned. For Release Order specifically, the order must also be in CRTD status.

'New session detected' dialog

Someone logged in with your credentials on another device. Click Refresh to continue on this device, or log in again from the Login App.

Page appears blank or redirects to login

Your session has expired or the cookies were cleared. Log in again from the Login App.

Sub-app (Assign Operators, Print Job Card etc.) doesn't open

Check that pop-ups are not blocked in your browser for this site. Allow pop-ups and try again.

For technical support, contact your IT team or system administrator.
